

# **Redefining Patient Access**

### It's not just a better patient experience. It's a better bottom line.

Online appointment scheduling is a leading differentiator in transforming patient access, but can it drive patient volume, increase referral capture and close gaps in care?

# Care coordination should cross the continuum

A traditional definition of patient access focuses on creating better channels for patients to access the care they need. More proactive approaches attempt to *make the process convenient* for patients at every step during their healthcare journey.

The reality is, you can get most things you need online. Simple purchases like shoes, books or food are one thing. But we take for granted even complex transactions like booking flights and hotels on a daily basis.

Even hailing a taxi from your phone is normal for many consumers. It seems like almost everything is available online. Everything, that is, *except* scheduling a doctor visit.

As Millennials have become the largest (and most tech-savvy) group in the US population, the ability to self-schedule appointments is quickly becoming more than a nice-to-have. But how important is it? Can it drive new patient volume or close gaps in care?

### Table of Contents:

- 1. Patient Access
- 2. Care Coordination
- 3. Close Gaps in Care
- 4. Referral Capture

- 6. Data Science
- 7. Overview
- 8. Conclusion

# Close gaps in care 5X

Population health call centers use outreach campaigns to contact patients about getting the care they need. It is an important effort to encourage wellness and adherence to care plans. To do this, agents use a combination of phone, email and text messaging to reach patients. But, in most cases, the actual scheduling of the appointment requires the patient to make an additional call to staff.

Often, the patient must remain on hold while a 3-way call is initiated, or is told to call a different number during business hours. This places unnecessary burden on the patient and as a result, prolongs the gap in care. Another problem occurs when the patient needs to reschedule this visit but is unable to through the reminder.

#### How can this be prevented?

If the agent has the ability to schedule directly into the referral specialist's system, 20 minute calls can be cut to 5 minutes while also decreasing the likelihood of a gap in care.

Not only is this 400% faster and more reliable for the call center, it's even easier for the patient to click a **Schedule Now** button in an email/text message – all without having to make a phone call. Call centers increase efficiency and can reach more patients. Patients can schedule on the spot. They do not have to make additional calls to get the right appointment and receive confirmation immediately to their smartphone calendar.

## **Decrease preventable readmissions**

If you have ever been referred by your physician, you know that the scheduling of the referral happens later. And that is a big problem.

In fact, over one third of patients receive a referral but 20% never follow through to schedule a visit. Of the referrals that are completed – a host of other challenges often result. Sometimes it's a lack of information between the two providers but occasionally, an incorrect specialist can be prescribed. As a result, the final outcome is poor for everyone involved; patient, referrer, and target provider all suffer.

As the shift to value-based care accelerates, providers share increasing responsibility for their patients following through on referrals. What needs to change?

Providers need to be able to schedule every referral before the patient exits the facility. Providers need to know if the patient attended the appointment and if additional care is necessary. A process that combines identification of the target provider, authorizations and a confirmed appointment is needed to deliver the best outcome.

Simply giving patients a confirmed appointment at the point of care results in a 25% increase in referral capture. Tracking and engaging no-show patients drives that figure up even higher. Together, this can transform the experience into one that is easy for patients, payers and providers.

## Gain market share

From our experiences with several of the largest health systems and payers in the US, online scheduling and referral platform enables a gain of 3+ new patients per month per provider. Here's how:

It creates a new channel. New patients can be captured that otherwise would have booked elsewhere. Enabling online appointment scheduling is more than simply adding a new access point. It appeals to a younger, commercially insured demographic who often self-schedule outside of practice hours.

**It optimizes your existing inventory.** By integrating all open calendar appointments into a single view, physician capacity can be optimized with surprising results. Many practices think they are at capacity and yet, only 70% of appointments are completed.

If the downstream value of a patient to a health system ranges between \$1100 and \$1500, adding 3 new patients per provider per month makes an immediate impact to the bottom line.

## Drive behavior change with data science

Data should help you identify whether an action you've taken is working. The effectiveness of a business decision should not be left to intuition.

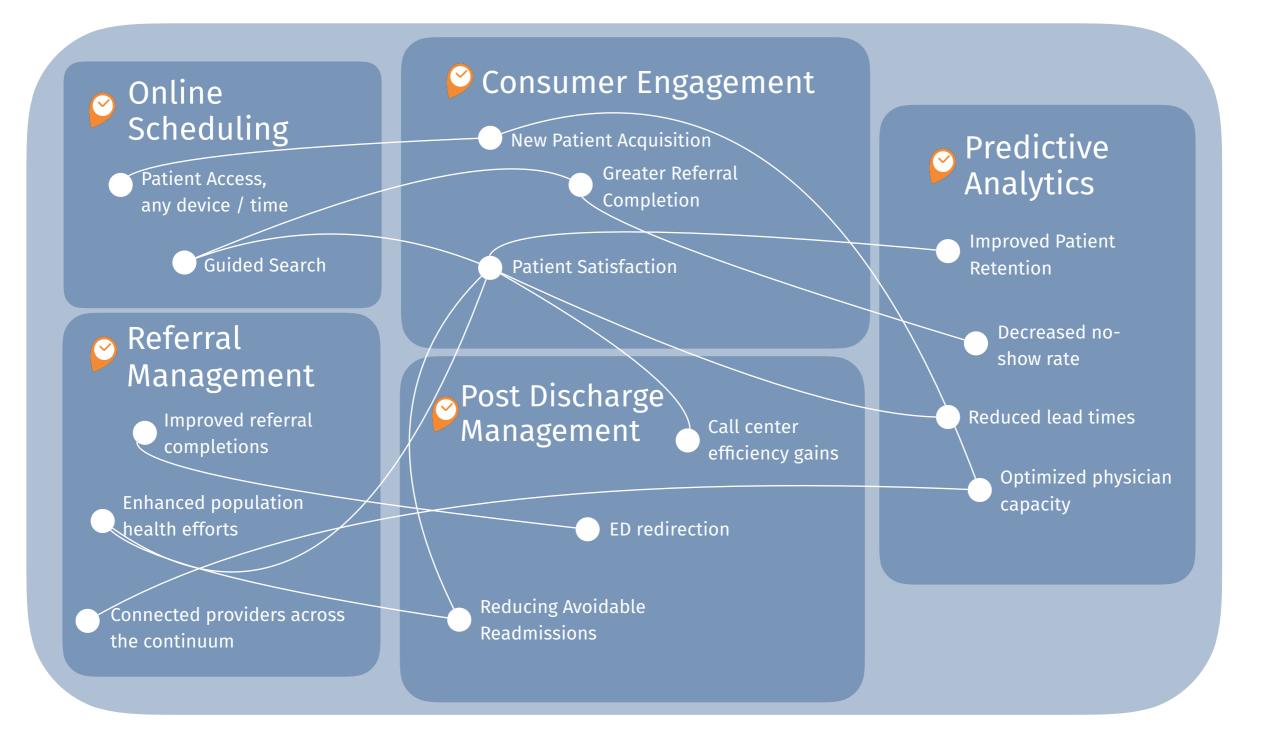

With the advent of user-friendly data analysis tools and an increased focus on data collection, measuring the results of an action is far easier. What if you had access to a tool with end-to-end visibility measuring your healthcare operations? Here are 5 things that your data should do for you:

- 1. Reduce no-shows
- 2. Eliminate long lead times
- 3. Optimize physician capacity
- 4. Book an alternative when capacity is limited
- 5. Measure results

"With realtime access to information that allows us to visualize trends, our referral coordinators can help ensure more timely access to care for patients." - Sigal Dor, Senior Director (BKI), NurseWise

## The big picture of patient access

A user-friendly referral and scheduling environment enables organizations to make healthcare delivery more convenient for everyone. It also ensures operational efficiencies can be rigorously optimized.

## Conclusion

A data-driven platform for referral management and online scheduling enables more than the right appointment. Key features include:

- Gaining market share through new patient acquisition.
- Reducing unnecessary readmissions.
- Driving behavior change to optimize capacity and outcomes through predictive analytics.
- Increasing patient retention and referral completion.
- Scaling population health efforts.
- Improving the patient experience by allowing patients to self-schedule care at their convenience.

In summary, new patient acquisition alone corresponds to an annual increase in profitability by \$43,200 per provider in new revenue (a conservative estimate). Streamlining care coordination and population health efforts drive additional value throughout the healthcare continuum. "Solving the complex problem of aligning the hospital discharge workflow to our scheduling process has dramatically decreased readmissions. It is a true win-win-win for the hospital, our practice and most importantly, the patients."

KYLE MATTHEWS, CEO Cardiovascular Associates of Mesa

#### About MyHealthDirect

MyHealthDirect connects patients with the right provider, at the right time, from anywhere. As the leader in patient access, MyHealthDirect provides a data driven platform for referral management and online scheduling. Founded in 2005, MyHealthDirect improves healthcare access in over 28 states with partnerships with the nation's largest health systems, providers and payers. Learn more at <u>myhealthdirect.com</u>.
